

(a) Student submission (round-robin arbiter, excerpt)

```
always @(posedge clk) begin
  if (!rst_n) base <= 2'd0;
  else if (gvalid)
    base <= gidx;          // keeps served
end                        // line highest-prio
```

(b) Backbone verdict (L1 property testbench)

```
VERDICT: REJECT (verifier-backed)
VIOLATION starvation: req[2]
  unserved for 5 cycles
  (req=0101 ...) [corpus-verbatim]
```

(c) LLM tutor message (pre-gate)

```
verdict: BUGGY
explanation: pointer must advance PAST
  the served index, or that requester
  keeps top priority and others starve
corrected_rtl: base <= gidx + 2'd1; ...
```

(d) Gate checks -> delivery

```
C1 verdict-consistency ..... PASS
C2 fix passes L0+L1+L2 ..... PASS
  (compile OK; P1-P3 hold;
   matches reference behavior)
=> DELIVER explanation + verified fix
   [71 ms, $0]
```

If C1 or C2 fails: the LLM text is withheld and the student receives the verifier-backed diagnosis in (b) — harmful feedback cannot reach the learner (76/76 intercepted in stress tests).
